This manual is also available for download from our website—www.aaon.com/controlsmanuals—under Sensors, where you can always find the latest literature updates.
The Wall Mounted E-BUS CO₂ Sensor is used for monitoring space CO₂ levels and is designed for permanent wall mounting in the conditioned space. It connects to the VCCX2 or VCB-X Controller using an EBC E-BUS Expansion Cable (supplied separately - see Table 1, below). It can be daisy-chained with the E-BUS Digital Room Sensor for applications requiring both a space CO₂ sensor and space temperature sensor. See Figure 1 for dimensions.

Some typical applications are:

- Controlling ventilation in a building where the occupancy varies frequently
- Controlling ventilation to ensure excess outdoor air is not causing energy waste
- Ensuring good air distribution throughout building zones

### Table 1: EBC E-BUS Cable Assembly Part Numbers

The CO₂ Sensor provides the following:

- Uses the patented dual beam Non-Dispersive Infrared™ (NDIR) technology
- A very accurate and stable sensor guaranteed to maintain its accuracy due to infrared self-calibration feature of sensor
- Sensor accuracy of +/- 50 ppm @ 1000 ppm or 2% of the measured value
- Annual drift of +/- 2 ppm per year
- Measurement range of 0 to 2000 ppm
- LED under front cover shows active CO₂ sensing
- Addressable based on function within the system

### Environmental Requirements

The E-BUS CO₂ Sensor needs to be installed in an environment that can maintain a temperature range between 14°F and 122°F and a humidity range between 5% and 95% RH (non-condensing).
Wall Mounted Space CO₂ Sensor Wiring to Unit Controller

Wall Mounting

The Wall Mounted E-BUS CO₂ Sensor utilizes a sub-base mounting plate with a modular phone jack providing quick and easy mounting and wiring. The wall-mounted sensor’s sub-base is compatible with standard junction boxes. A locking screw secures the assembly to the wall.

Optional Mounting Plate

Included with the Wall Mounted E-BUS CO₂ Sensor is a mounting plate that can be used, if necessary, to cover the sensor sheet rock opening. This mounting plate screws onto the back of the housing base. The mounting plate is then mounted and covers the recessed space in the wall. A locking screw secures the sensor to the wall. See Figure 6, page 7 for dimensions.

Wiring to the Unit Controller

The Wall Mounted E-BUS CO₂ Sensor connects to the VCCX2 or VCB-X Controller with an EBC E-BUS expansion cable. It can be daisy-chained with the E-BUS Digital Room Sensor for applications requiring both a space CO₂ sensor and space temperature sensor. Refer to Figure 2 for instructions (VCCX2 Controller shown).

Figure 2: Wall Mounted Space E-BUS CO₂ Sensor & E-BUS Digital Room Sensor Wiring for VCCX2 Controller
### Addressing & LEDs On/Off

The Wall Mounted E-BUS CO₂ Sensor is equipped with binary dip-switches. The Address Switch is located on the Sensor’s board and is only visible by taking the device off the wall and removing the back cover. See location in Figure 3. The default addresses are as follows:

- Space or Return CO₂ Sensor = Address 1
- Supply CO₂ Sensor = Address 2 (Future)
- Open addresses for Custom Applications = 3-15
- LEDs On = Dipswitch 8 ON

**NOTE:** If you forget to set the address, and all dipswitches are off, the address will default to address 1.

To set the address, follow these instructions:

1. Power up the VCCX2 or VCB-X Controller that the Sensor is plugged into.
2. Set the Dipswitch to the proper setting.
3. The address range can be set from 1 to 15.
4. To verify that the correct address has been entered, refer to the STATUS LED information on page 6.

The board address is stored in nonvolatile memory. Once the address is set, the address will be saved after loss of power. See Figure 3 below for address switch setting information.

Troubleshooting

Using LEDs to Troubleshoot

LEDs are available for troubleshooting the CO₂ Sensor. The LEDs are ON when Dipswitch 8 is on. The LEDs are off when Dipswitch 8 is off. The Front LED is visible through the front cover of the CO₂ Sensor. See Figure 5 for location. The other LEDs are located on the Sensor’s board and are only visible by taking the device off the wall and removing the back cover. See Figure 4 for locations.

Front LED
When the LEDs are turned on, a green LED will be visible through the front plastic cover of the CO₂ sensor. See Figure 5. The Front LED will blink whenever a CO₂ sample is taken. A sample is taken every 30 seconds.

STATUS LED
Initially, the STATUS LED blinks fast for 30 seconds. It then stays on and blinks the board address whenever a CO₂ sample is taken. A CO₂ sample is taken once every 30 seconds.

COMM LED
The COMM LED blinks on whenever communications are sensed.

Altitude Correction
Altitude correction can be configured using one of our operator interfaces. The altitude can be configured at a value of 0-15,000 feet. The default is 500 feet.

TB1 Terminal Block (CO₂ Reading)
The TB1 terminal block should only be used to test the sensor when the sensor cable is plugged into the controller and the sensor and controller are powered up. Directions: Set the meter for DC volts and connect the GND probe to the GND terminal and the + probe to the CO₂ 0-5 terminal. Look at the output voltage and record it. Multiply the voltage times 400. The value should match the CO₂ as read on the System Manager TS, Modular System Manager, Modular Service Tool, or Prism 2. If the signal doesn’t match the sensor reading, contact AAON Controls Support.
Optional Mounting Plate

Included with the Wall-Mounted E-BUS CO₂ Sensor is a mounting plate that can be used, if necessary, to cover the sensor sheet rock opening. This mounting plate screws onto the back of the housing base. The mounting plate is then mounted and covers the recessed space in the wall. A locking screw secures the sensor to the wall. See Figure 6, below for dimensions.
